Almost every chapter begins with an example or discussion of elementary nature. Following a discussion of the fundamentals, the text is almost entirely devoted to linear problems, but the unifying concepts of linear space are fully developed after the student is exposed to a number of practical mathematical techniques.

Following mathematics: the theory of partial differential equation, variational calculus, Fourier analysis, potential theory, and vector analysis are perhaps most closely associated with mathematical physics. These were developed intensively from the second half of the 18th century (by, for example, D'Alembert, Euler, and Lagrange) until the 1930s.. Physical applications of these developments ...
