Everyday Heat Transfer Problems Sensitivities

By M. Kemal Atesmen. This book uses everyday practical examples to illustrate sensitivities of heat transfer problems to governing variables in a concise and readable format. Examples include cooling of a chip, sizing a solar collector for a pool, cooking a turkey, solar tanning, ice formation on a lake, and more.

Heat generated in pipes or in orifices due to fluid friction in high-viscosity fluids can be substantial. In the present analysis, the heat generated in steady-state and fully developed pipe flows is investigated for fluids of different viscosities.

Conduction heat transfer in printed circuit boards (PCBs) has been studied extensively in literature i.e., B. Guenin [4]. The layered structure of a printed circuit board is treated using two different thermal conductivities; one is in-plane thermal conductivity and the other is through-thickness thermal conductivity.

Heat transfer from the sides of the cryogenic bottle will be considered. The top and the bottom surfaces of the bottle are assumed to be well-insulated. The temperature of the inner wall of the inner tube is assumed to be that of liquid nitrogen, namely a negligible convection heat transfer resistance between the liquid nitrogen and the inner ...

By assuming constant thermophysical properties and no heat sources in the pipe wall, the heat conduction equation for the temperature distribution, T , is: $d^2 T / dr^2 + (1/r) dT/dr = 0$ If the temperatures at the inner surface, T_i , and the outer surface, T_o , of the pipe wall are known, Eq.

In this book, I will provide sensitivity analyses to well-known everyday heat transfer problems, determining $\partial y/\partial x_1$, $\partial y/\partial x_2$, $\partial y/\partial x_3$, ..., $\partial y/\partial x_n$ for each case. The analysis for each problem will narrow the field of independent variables that should be focused on during the design process.
