A graph drawing algorithm reads as input a combinatorial description of a graph G , and produces as output a drawing of G according to a given graphic standard. The drawing is described in terms of graphics

Algorithms for Drawing Graphs: an Annotated Bibliography

The crossing number of a drawing is the number of pairs of edges that cross each other. If the graph is planar, then it is often convenient to draw it without any edge intersections; that is, in this case, a graph drawing represents a graph

The Reingold-Tilford tree-drawing algorithm draws ordered trees (that is, trees where the edges from a vertex are ordered). Your examples suggest that your graphs are not ordered, and indeed that the main issue you face is finding an edge-ordering which minimizes edge-crossing. So possibly this is the problem
