Ethiopian Population Dermatoglyphic Study Reveals ...

Dermatoglyphics is a study of configurations of epidermal ridges on certain body parts, namely, palms, fingers, soles, and toes. The term is derived from ancient Greek: derma = skin, glyph = carving. Dermatoglyphic patterns begin to develop in the 10 th week of gestation and are complete by the 24 th week.

Two studies from an Iranian research group [14, 15] were evaluated, and it could not be determined for certain if they pertained to the same study population. However, since the earlier study [14] contained what appeared to be errors in presenting tabular material, it was decided to only include the latter study [15] in the review.
